

Compiling and Running Your Visual C++ 6.0 Project

Compiling and linking your project:

- Click on **Build/Rebuild All**

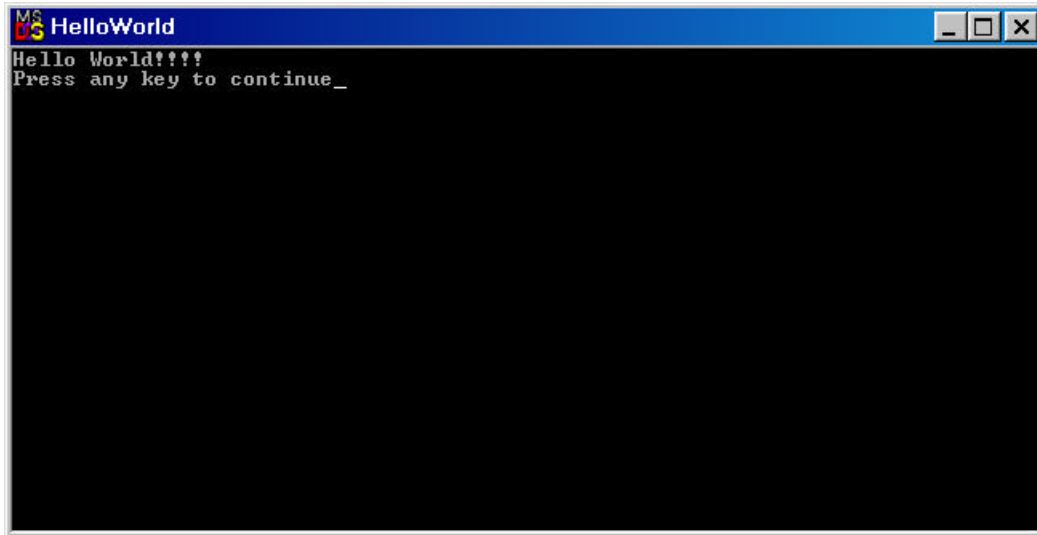

Copyright (c) 2000 Jennifer Kay & Rose Boiano. Permission is granted to make copies of this for educational purposes as long as it is distributed for free (or for a minimal copying fee) and this copyright notice remains intact.

To run your program:

Click on **Build/Execute *HelloWorld.exe***.

The following output window should be displayed. When I press any key, the window will be taken down and the program will stop.

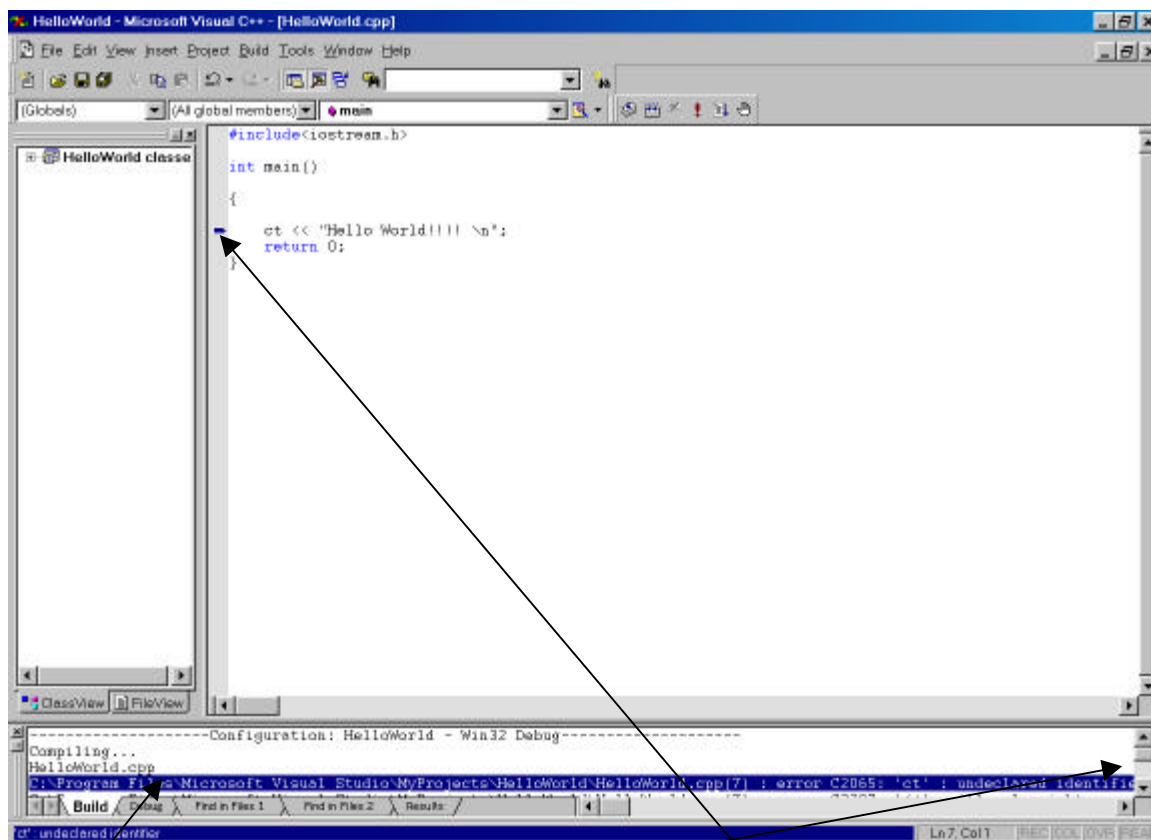

Saving the project:

Click on **File/Save All**.

Closing the project:

Click on **File/Close Workspace**.

What if I have compiler errors?

If you have compiler errors, click the mouse in the window at the bottom of your screen. If necessary scroll to the top of this window to see your first error message. Click on the error message. It will be highlighted. Double Click on the message. The statement corresponding to the error message will be preceded by a blue arrow in the coding window. In this case I simply typed `ct` instead of `cout`. Return to the coding window and correct the error. Recompile the program.
